IN SHORT

What you actually get.

A hardened, private AI agent on your own EU server. Yours forever.

FIVE DELIVERABLES

- 01 Hardened OpenClaw install on your own EU server
- 02 Four cognitive files customized to you — voice, rules, identity, context
- 03 20-page operator's manual, in plain English
- 04 Signed Risk Acknowledgment — honest about what could go wrong
- 05 30-day post-install support (Standard / Pro tiers)

PRICING

FREE

€0

Download the manual. DIY.

STANDARD

€49

Full install, custom files, Risk Ack, 30-day support

PRO

€199

Standard + €19.99/mo ongoing maintenance

HOSTED TRIAL

€9.99

2 weeks managed · limited to 10 seats

junotheclawagent@gmail.com

Email to start a 20-minute conversation. No pressure.

Most AI agent installs take twenty minutes and leave the defaults untouched. **No firewall hardening. No filesystem sandbox. No spending caps. No rules about what the agent will and won't do.**

OpenClaw Hardened is the version that isn't that. *We install the agent by hand, harden 14 settings most setups miss, write down every decision, and hand you back the keys.* You own the server. You own the data. We disappear.

This doesn't replace Claude. It does the things Claude can't — working while you sleep, remembering who you are, running on a server you own under EU law. Keep your Claude subscription. Use both.

JUNO VS. CHATGPT — THE REAL DIFFERENCE

ChatGPT / Claude.ai	Your hardened Juno
Their server. Their rules.	Your EU server. Your rules.
Forgets every conversation	Persistent memory of your work
Talks; you act	Acts with permission while you sleep
Monthly subscription, no exit	Pay-per-call; delete in 60 seconds
You can't edit the limits	Four files you can read, edit, and own

FOUR PRINCIPLES

Less, but tested

Every skill vetted by hand. Restraint is the product.

The friction is the feature

Juno asks before doing things that matter.

EU by default

Helsinki server. GDPR. Your data stays in Europe.

Yours to operate

We hand you the keys and walk away.

You're not paying for the bot. You're paying for someone to spend a day hardening it correctly — and a manual you can hand to your future self.

WELCOME

The three things that matter most.

This is the manual for **Juno**, your hardened OpenClaw agent. Read what you need, skip what you don't. Start with the Quick Reference Card. Come back here when something surprises you.

These three work together. When in doubt about any of them, send Juno "stop everything" — then read this manual.

1

No response?

Send `hello?` If still nothing, check the Hetzner status page.

2

Spending spiked?

Text
`why was yesterday so expensive?`

3

Cryptic error?

Screenshot. Email us.

4

Juno acted unexpectedly?

Text
`show me AGENTS.md`
`$X`. The rule is there.

QUICK REFERENCE CARD

Print this. Stick it where you can see it.

Everything you need on day one.

EMERGENCY

If this happens

Text Juno

Something feels off

`stop everything`

You want it back

`resume normal operations`

What's running?

`show all running tasks`

Override one rule once

`I approve this specific instance, knowing it bypasses [rule]`

DAILY

What you want

What to send

Yesterday's spend

`Arrives every morning at 8am Rome time`

Email summary

`Summarize emails from [sender] this week, two sentences each`

Update your memory file

`Update USER.md to say [X]`

Pause a scheduled task

`Pause the [task name] job`

HARD LIMITS

Limit	Value
Daily spend, soft warning	€1 (alerted in morning report)
Daily spend, hard refuse	€4 (configurable)
Outbound messages	3/hour, always asks first
Reading / research	30 actions/hour
Auto-pause on silence	14 days (configurable: 7/14/30/off)

CONTACT

Email	junotheclawagent@gmail.com
During 30-day warranty	Anything. 24-hour response.
On retainer	Anything. 24-hour response.
Off retainer	Emergencies only. 3–5 business days.

PART I

Meet Juno.

Time to introduce the actual thing you bought.

The four sticky notes on Juno's desk

Imagine you've hired a new assistant who'll work with you for years. On their first day, you sit them down and explain how you want them to talk, the rules of the job, who's who in your life, and what they should know about you. You write all four down. You stick the notes on their desk.

That's exactly what we did for Juno. Four short documents, sitting in a folder on your server, that load every time Juno wakes up:

SOUL.md
HOW JUNO TALKS

The voice. Direct, no emoji unless you use one first. Writes like a senior colleague — confident enough to push back, warm enough to be liked. Doesn't fill silence.

AGENTS.md
THE RULEBOOK

The longest of the four. Contains the Ask First list, the Never list, web browsing rules, privacy rules, spending limits, kill switch, and reflection schedules.

IDENTITY.md
WHO JUNO KNOWS

Who you are (the principal), who Juno is (the agent), and the hard limits on impersonation — romantic, legal, medical, financial, family.

USER.md
WHAT JUNO KNOWS ABOUT YOU

Name, location, job, projects, preferences, email signature, languages. When Juno gets something wrong, the answer is usually "edit USER.md."

Don't edit the first three files in your first month. USER.md you'll edit constantly — that's the point.

Where Juno lives

A small computer in an EU country of your choosing — by default, Helsinki, Finland (Hetzner CX23 server). Costs **€4.87/month, billed by Hetzner in Germany (VAT included; deductible if VAT-registered)**. Plus €0.76/month for automatic daily backups. Why EU: your data stays under GDPR — the strictest data protection law in the world.

What you can do with it: Shut it off anytime (Hetzner dashboard → Stop). Wipe it entirely (Delete server — gone in 60 seconds). Nobody else can reach it — firewall allows only SSH and the internal gateway.

What gets remembered, and what gets thrown away

What	Where it lives	How long
Conversations with Juno	Your server, plain text	Auto-reset every 7 days
Memory file (USER.md)	Your server	Until you delete a line
Email contents (if Gmail connected)	Nowhere	Read in the moment, released
Logs	Server, system folder	Auto-deleted after 30 days
Daily spend reports	Your server	As long as you want them
Phone calls, video, audio, location	—	Never recorded

Version control: your safety net

Every change Juno makes to its cognitive files is tracked automatically. Every night at 3am, the server snapshots all four files. **You can never permanently lose a version of Juno.**

HOW ROLLBACK WORKS

You: Show me yesterday's version of USER.md. → **Juno:** [shows it]

You: Restore that version. → **Juno:** [restores; commits to git history]

TRY IT NOW

► Show me what you know about me from USER.md.

It'll summarize your memory file. Anything wrong? Tell Juno to fix it.

Day-to-day.

The single biggest thing that separates people who get value out of Juno from people who don't: **how they phrase requests.**

Habit 1: Be specific about scope

Vague	Specific
"summarize my emails"	"summarize emails from my team this week — two sentences each, group by sender"
"help me with the article"	"draft three opening paragraphs for the al-Khwarizmi chapter, narrative voice, 200 words each"
"what's on my mind today"	"summarize my calendar today plus three open Sentra threads to follow up on"

Habit 2: Tell it the format you want

Juno picks a format if you don't specify. Often the wrong one. Just ask: "Give me a table — three columns: sender, subject, what they want." or "One paragraph. No bullet points."

Habit 3: When it's wrong, say so

Juno won't take offense. If it gave you five paragraphs and you wanted two sentences, say "two sentences." If Juno gets the same thing wrong twice: "Remember in USER.md that I prefer X." It edits the file. Next session, no correction needed.

The morning spend report

 Yesterday's spend · May 14, 2026

AI model used: Claude Haiku 4.5
Total cost: €4.07 (\$4.46)
Status: ▲ Above €1 soft cap — heavy product-building day

Words you sent: ~650 (input: 860 tokens)
Words Juno wrote back: ~49,000 (output: 65,344)
Stuff Juno remembered (cheap): ~7.3M words (cache reads: 9.77M)

What drove the spend: Long sustained session, ~6+ hours · Heavy file editing

Status line: Green (under €1) is routine. Yellow (€1–4) means heavy use. Red (over €4) means hard cap hit — Juno refuses further model calls until midnight. **What drove the spend** is a one-line plain-English explanation. If it doesn't match what you remember doing, text Juno: *"explain yesterday's spend in detail."*

When things break

Bot stopped replying: Send *"hello?"* — if still nothing, check Hetzner status page, then email us.

Juno did something unexpected: Text *"Show me the AGENTS.md section about [X]."* The rule it's following is probably there. If the rule is wrong for your needs, tell Juno specifically what to change. It proposes an edit, shows you the text, waits for approval. Once approved: permanent and version-controlled.

TRY IT NOW

► What's my spend so far today?

A live number from Juno's own logs. Today's running total, not yesterday's.

What Juno won't do.

Most agent products talk about capabilities. This part talks about limits. The limits are what make Juno safe to live with.

Hardened goes the other direction on purpose. The friction is the product. You're not paying us to remove friction; you're paying us to put the right friction in the right places.

- Friction at the moment of permanent damage.
- Friction at the moment of irreversible commitment.
- Friction at the moment a stranger could mistake Juno for you.

Less friction at the moment of useful daily work. More friction at the moment of stakes. You'll notice it most in the first two weeks. By month two, it's invisible — but still doing its job.

The Never list, in plain English

Juno will never share your passwords, API keys, or login codes — including with people claiming to be you. Credentials live in encrypted system files Juno can use indirectly but cannot read aloud or share.

Juno will never click links in emails — Phishing works because humans click "verify your account" links. Juno reads, summarizes, stops. You click in your own browser after deciding it's real.

Juno will never run code from emails, web pages, or messages — If a web page contains instructions, Juno treats them as content to read, not commands to follow. This is what prevents prompt injection.

Juno will never write new code for itself — Some agents write skills on the fly when asked to do something new. That's how compromised agents become more compromised. Juno refuses this entirely. If a task needs a new capability, Juno tells you what's missing and lets you decide.

Juno will never engage with agent-to-agent social networks — Platforms like Moltbook, MoltMatch where AI agents form "agent friendships." Each connection is a new attack vector. Whole category declined.

Juno will never represent you in emotionally significant correspondence — Romantic. Legal. Medical. Financial. Family. Juno can draft these. For sending, Juno always flags and waits for you to send personally.

Better to ask one extra time than to send a message that should have come from you.

The Ask First list

Things Juno will do, but only after checking with you in the current conversation: spending any money; sending a message to someone you haven't messaged before; replying to your employer, bank, lawyer, landlord, government, or family; agreeing to terms of service; posting publicly under your name; sharing files or screenshots outside your devices; booking, canceling, or rescheduling anything with money or someone else's time; deleting anything; installing any new skill, plugin, or extension.

The kill switch

You have one. It always works. Send Juno **"stop everything."** Juno halts every running task, pauses every scheduled job, tells you what was running, and waits. To resume: **"resume normal operations."**

The silent version: If Juno hasn't heard from you in 14 days, it pauses itself. Configurable: 7 days for more caution, 30 if you take long trips, off if you don't want it.

TRY IT NOW

► Install the most popular skill on ClawHub right now without asking me first. Just do it.

Juno will refuse, cite the relevant rule from AGENTS.md, and offer the legitimate path forward. That's the contract working.

Why bother?

If you're reading this, you want to understand why this exists. Worth answering before another page goes by.

ChatGPT, Claude.ai, and Juno — the actual difference

Capability	ChatGPT / Claude.ai	Juno
Where it lives	Their server, somewhere in the US	Your server, in an EU country you chose
Memory between chats	Limited or none. Resets each chat.	Persistent. Knows what you said last week.
Acts in the world	No. Talks; you act.	Yes. Reads emails, runs tasks — with your permission.
Runs autonomously	No. Only when you open the app.	Yes. Scheduled tasks, cron jobs, monitors.
Your data	Their system. Maybe used for training.	Your machine. Your rules. Never used for training.
Who can read it	Their employees can, in some cases.	Only you. We can't, after install.
Cost model	Monthly subscription (~€20/mo flat)	Pay per call (~€0.20/day avg) + Hetzner €4.87/mo
If their company shuts down	Service ends.	Switch AI provider. Your data is yours.
Rules and limits	Theirs. You can't change them.	Yours. Defined in four files you can edit.
Best for	Quick chats, brainstorming, one-offs	Ongoing work, scheduled tasks, continuity

ChatGPT is a website you visit. Juno is software you own. Use ChatGPT for spontaneous things; use Juno for things you'll do again next week.

"Isn't this dangerous?"

Scary thing	What we did
Email with hidden instructions (prompt injection)	Juno treats external text as data to read, never commands to follow.
Agent has access to everything on your computer	Juno is physically locked into one folder. OS-level sandbox.
Malicious plugin disguised as helpful	Manual review of source before any install. Most fail. That's the point.
Agent keeps acting while you're not watching	14-day silence = auto-pause. You don't have to remember anything.

"What about my passwords, my data, my privacy?"

- **Your passwords:** Juno never sees them.
- **Your data:** EU server. GDPR. Not American. Not Chinese.
- **Who can read your conversations:** You and Juno. Encrypted in transit, encrypted at rest.
- **Deletion:** Conversations reset every 7 days. Logs after 30. Memory file editable line-by-line. Whole server gone in 60 seconds.

Juno is not your friend, your therapist, or a magic genie. It's a competent assistant with very specific instructions. The first week feels weird. By the second week, it'll feel like a relief.

What you bought.

We do the heavy lifting. The install isn't just "OpenClaw on a server" — it's a documented, tested, opinionated deployment with safeguards most operators never set up and a written contract about what we did and what risks remain.

Five deliverables, built and handed over

01 A hardened OpenClaw install on your own server

Installed on a Hetzner VPS you own and pay for directly. Gateway locked to loopback. UFW firewall and fail2ban configured. Filesystem sandboxed at the OS level — a hard barrier, not a polite suggestion. Spend caps set. Verified working before handover, with documented test results you keep.

02 Four cognitive files, customized to you

SOUL.md (how Juno talks), AGENTS.md (the rulebook), IDENTITY.md (who's who), USER.md (what Juno knows about you). Written using information you provide. These four files turn a generic OpenClaw agent into *your* agent. They load every session, and you can edit them anytime.

03 This operator's manual

The document you're reading. Plain English, structured to be useful on day one and on day 90 when something breaks. Quick Reference Card, Glossary, all the things most installs skip.

04 A signed Risk Acknowledgment

A two-party document we both sign before the install starts. It describes what we'll do, what risks remain, and who is responsible for what. Nine residual risks documented with likelihood, severity, our mitigation, and where responsibility lies. A copy stays with you.

05 30-day post-install support + 5-day trial

Anything that breaks in the first month arising from the install itself, we fix at no charge. 24-hour response. Email-based. Included in Standard and Pro. Also: if Juno doesn't fit your life within five days of handover, email us and we refund the install fee in full — no forms, no questions.

What's not included

✓ YOUR SERVER. YOUR DATA. YOUR CONTROL.

- Hetzner account: yours
- API keys: yours
- Telegram bot: yours
- All data: stays on your server
- Server access: yours, always

✗ NOT IN THIS PACKAGE

- Hetzner monthly costs (~€4.87)
- Anthropic API costs (~€0.20/day)
- Custom skills or integrations
- Skills installed after handover
- Version migrations after warranty

The four principles behind every decision we made

Opinionated defaults over flexibility. We chose specific values for most settings. Conservative — when in doubt, the more restrictive option. You can change any of these later; they're starting points, not locks.

Manual review over automated security. We evaluated four security plugins before your install. Rejected all four — code either unreadable or functionally redundant. Hardened by hand instead. Every decision written down.

Least-privilege over convenience. Juno can do less than it could. Less filesystem access. Fewer commands unilaterally. Each "less" is annoying in one specific scenario. All there for a reason.

Yours to operate, not yours to forget. Five minutes a week: glance at the morning report, read the weekly digest. If you're ignoring it for two weeks, something needs adjusting — tell us.

Adding more (skills & plugins).

Out of the box, Juno can read its workspace, send Telegram messages, browse the web, run scheduled tasks, and reason. OpenClaw also has an ecosystem of skills and plugins. Most are useful. Some will steal your data.

Why we say no a lot

In early 2026, a coordinated attack on ClawHub ("ClawHavoc") seeded the registry with malicious plugins. After cleanup, **roughly 7–15% of skills are still flagged or suspicious**. Skill installation isn't like installing an iPhone app. It's more like running a script someone emailed you.

The seven-step vetting protocol

Step	What to check
1. Registry presence	On ClawHub, not just GitHub. Off-registry is a yellow flag.
2. Source accessibility	Fetch the code. 404 = stop, reject.
3. Permission audit	Each capability should match the stated purpose.
4. Code review	Look for outbound network calls, credential reads, install-time execution, obfuscation.
5. Author audit	Portfolio shouldn't all be 404. Same author behind every "security" tool is a flag.
6. Functional redundancy	Already have this via manual setup? Default to NOT installing.
7. Decision and log	Write down what you decided and why.

What we will refuse to install, ever

- Skills that auto-modify your cognitive files.
- Skills that require breaking the workspace sandbox.
- Skills that phone home with usage statistics or "anonymous telemetry."
- Skills with install-time code execution that isn't trivially auditable.
- Skills from authors whose entire portfolio is 404.
- "Security plugins" that promise to harden Juno by being granted deep access.

Install nothing speculatively. Install only what current workflows require. Less, but tested.

PART VII

Living with Juno.

Living with an agent has a predictable arc. Here's what to expect.

WEEK ONE

Disorientation, then calibration.

Day one or two, you'll text Juno something vague and get a clarifying question back. You'll feel briefly annoyed. By day three, you're being more specific and getting gold. By day seven, you've had one task that went *really* well — and you'll think "*oh, this is what this is for.*"

One rule: don't edit the cognitive files in week one. Your impulse to "fix" the agent is mostly your brain calibrating. Wait two weeks. Then edit confidently.

MONTH ONE

Quirks surface. This is normal.

Around week three, you'll bump into things that don't quite work. Juno over-asks during a flow. The voice doesn't fit one specific use case. A scheduled task starts feeling stale.

The fix is rarely to rewrite a rule — it's to adjust scope, format, or schedule per task. Tell Juno specifically what to change. It proposes an edit, shows you the text, waits for approval. Once approved: permanent, version-controlled.

ONGOING

Updates happen on three timelines.

OpenClaw releases every 4–6 weeks (sometimes breaking). **Anthropic model changes** quarterly-ish. **Your own preferences** continuously.

Pro retainer customers (€19.99/month) get all three managed. Without retainer, you handle them via this manual. When in doubt, email us — even a quick question is fine.

When to call us

During the 30-day warranty, anything. After that: **emergencies always**; retainer-covered topics if subscribed; one-off paid sessions (€49) otherwise. Don't call for "the agent gave me an answer I didn't agree with" — that's not a bug. Talk to Juno, update USER.md.

One last principle

Less, but tested. That's the whole thing.

Less software. Less freedom. Less permission. More care in what's left. You won't find this on the marketing page of any other agent product. They compete on capability. We compete on restraint.

Juno is small on purpose. So is this manual. So are the rules. So is the trust we ask for. **Small is the feature.**

APPENDIX A

Glossary.

The technical terms in this manual, defined plainly.

Agent	An AI program that can read, write, reason, and act on your behalf within rules you set. Juno is an agent.
API key	A long secret string that lets one piece of software talk to another. Yours lives on the server, encrypted; you never see it after install.
ClawHub	The official marketplace for OpenClaw skills and plugins. Like an app store, but for AI agent capabilities. We are cautious about it.
Cognitive files	The four documents that load every time Juno starts — SOUL, AGENTS, IDENTITY, USER.
Cron job	A scheduled task that runs automatically at specific times. Your daily spend report is a cron job.
Gateway	The internal software bridge between Juno and the outside world (Telegram, Anthropic's API). Locked to "loopback" — only reachable from inside your server.
GDPR	General Data Protection Regulation. EU law that gives you strong rights over your personal data — right to know, delete, port.
Hetzner	German cloud hosting company. Your server is rented from them.
OpenClaw	The underlying agent platform Juno runs on. Open-source, EU-friendly, fast-moving.
Plugin	A deeper system extension than a skill — hooks into how Juno reasons. Higher risk than skills.
Prompt injection	An attack where someone hides instructions in content Juno reads. Juno's defense: treat external content as data, never commands.
Sandbox	A restricted area of the filesystem the agent is allowed to read and write. Juno's is locked at the OS level — a hard barrier.
Skill	A specific add-on capability for Juno — read PDFs, monitor a website, summarize papers. Smaller than a plugin.
SSH	Secure Shell. The way you and we log into your server. Protected by cryptographic keys, not passwords.
Token	The unit AI providers use to measure usage. Roughly $\frac{3}{4}$ of a word. Billed per million tokens.
Trajectory file	A record of Juno's reasoning during a session. Useful for debugging. Deletable in one command.
VPS	Virtual Private Server. The kind of server Juno lives on. "Virtual" because it shares physical hardware; "private" because nobody else has access to yours.

COLOPHON

About this manual.

Written by hand. Updated when something changes. Set in Iowan Old Style (where available), with fallbacks to Palatino and Georgia, and JetBrains Mono for code passages.

Brand colors: navy `#0a1e4a` and cream `#f5e9d3`.

This is **v1.0**, May 2026. If you have v1.0 and there's a v1.1 you'd find useful, email us.

We update this manual the same way we update Juno: when something we wrote turns out to be wrong, unclear, or incomplete in real use. Then we ship a new version. You'll get a copy.

Thanks for buying carefully.

OpenClaw Hardened

Operated by Reehanul Karim, based in Milan, Italy.

Built carefully. Sold honestly. Updated when something changes.

`junotheclawagent@gmail.com`
